

**Rules:**

- Unless otherwise stated, all answers must be mathematically justified.
- Partial answers will be graded.
- Your submission has to be uploaded to Gradescope. In Gradescope, indicate the page on which each problem is written.
- You can work in groups but each student must write his/her/their own solution based on his/her/their own understanding of the problem. Please list on your submission the students you work with for the homework (this will not affect your grade).
- Problems with a (★) are extra credit, they will not (directly) contribute to your score of this homework. However, for every 4 extra credit questions successfully answered your lowest homework score get replaced by a perfect score.
- If you have any questions, feel free to contact me (mgabrie@nyu.edu) or to stop at the office hours.

**Problem 3.1** (2.5 points). *True or false? Give a reason if true and a counterexample if false. Note that singular is another way of saying "not invertible".*

- A square matrix with a column of zeros cannot be invertible.*
- If every row of a matrix adds up to zero the matrix must be singular.*
- If every column of a matrix adds up to zero the matrix must be singular.*
- Every matrix with 1's down the main diagonal is invertible.*
- If  $A$  is invertible, then  $A^{-1}$  and  $A^2$  are invertible.*

**Problem 3.2** (2.5 points). Let  $A = \begin{pmatrix} 5a-2 & 3a & 3a-3 \\ -4a+2 & -3a+1 & -2a+2 \\ -4a+2 & -3a & -2a+3 \end{pmatrix}$  for a real number  $a$ .

- Determine the rank of  $A$  for all values of  $a$ , remember that you can use linear operations on rows and columns.*
- Determine a basis of the nullspace  $\text{Ker}(A)$  and image space  $\text{Im}(A)$  for  $a = 0$ .*

**Problem 3.3** (2 points). Let  $A = \begin{pmatrix} 1 & 0 \\ 2 & 3 \end{pmatrix}$ ,

$$B = \begin{pmatrix} 1 & 0 & 0 \\ 2 & 3 & 0 \\ 4 & 5 & 0 \end{pmatrix} \text{ and } C = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 2 & 3 & 0 & 0 \\ 0 & 4 & 5 & 0 \\ 6 & 0 & 7 & 8 \end{pmatrix} \text{ and } D = \begin{pmatrix} 1 & 0 & 0 & 0 \\ 2 & 3 & 0 & 0 \\ 0 & 4 & 0 & 0 \\ 0 & 5 & 6 & 0 \end{pmatrix}$$

- Determine the ranks of  $A$ ,  $B$ ,  $C$  and  $D$  by reasoning on the dimension of the span of the columns of the matrices.*
- Consider a generic lower-triangular matrix  $M \in \mathbb{R}^{n \times n}$  (meaning that the entries  $M_{ij} = 0$  if  $j > i$ ). Show that if all diagonal entries of  $M$  are non-zero,  $M$  is invertible.*
- Show that if one of the diagonal entries  $M_{ii} = 0$ , then the matrix is not invertible.*
- Consider a generic upper-triangular matrix  $M \in \mathbb{R}^{n \times n}$  ( $M_{ij} = 0$  if  $j < i$ ). At what condition is  $M$  invertible?*

**Problem 3.4** (2 points). We will build a formal proof that for all  $L \in \mathbb{R}^{n \times m}$ ,  $\text{rank}(L) = \text{rank}(L^\top)$ .

- (a) Show that for any matrices  $A \in \mathbb{R}^{n \times k}$ ,  $B \in \mathbb{R}^{k \times m}$ ,  $\text{rank}(A) \geq \text{rank}(AB)$ .
- (b) Given a matrix  $L \in \mathbb{R}^{n \times m}$ , show that  $\ker(L) = \ker(L^\top L)$  (hint: you may want to consider  $y = Lx$ ).
- (c) Using (a) and (b) Deduce that  $\text{rank}(L) = \text{rank}(L^\top)$  (hint: use the rank-nullity theorem).

**Problem 3.5** ( $\star$ ). Let  $A \in \mathbb{R}^{n \times n}$  given by

$$A = \begin{pmatrix} 0 & 0 & \cdots & 0 & 1 \\ 0 & \cdots & \cdots & 1 & 0 \\ \vdots & & & \vdots & \\ 0 & 1 & 0 & \cdots & \vdots \\ 1 & 0 & \cdots & \cdots & 0 \end{pmatrix}.$$

Compute  $A^k$  for all  $k \in \mathbb{N}$ .
